

**AusVELS 9.0** Students will be able to apply the distributive law to the expansion of algebraic expressions, including binomials, and collect like terms where appropriate.

### Expanding single brackets

To expand brackets in an algebraic expression, multiply the term outside the brackets by each of the terms inside.

$$3(x + 4y) = 3 \times x + 3 \times 4y = 3x + 12y$$

### Simplify by collecting like terms

Expand the brackets and then add or subtract like terms

$$\begin{aligned} 4(x + 5y) + 7(2x - y) &= 4(x) + 4(5y) + 7(2x) + 7(-y) \\ &= 4x + 20y + 14x - 7y \\ \text{Take the like terms, } x \text{ with } x \text{ and } y \text{ with } y & \\ &= (4x + 14x) + (20y - 7y) \\ &= 18x + 13y \end{aligned}$$

### Expanding Pairs of Binomials

Using FOIL

**First:** multiply the **first** terms in each bracket together

**Outer:** multiply the two **outer** terms

**Inner:** multiply the two **inner** terms

**Last:** multiply the **last** terms in each bracket together

Using FOIL to expand  $(y + 2)(y - 4)$

$$\begin{aligned} (y + 2)(y - 4) &= (y \times y) + (y \times -4) + (2 \times y) + (2 \times -4) \\ &= y^2 - 4y + 2y - 8 \\ &= y^2 - 2y - 8 \end{aligned}$$

**Expanding Perfect Squares**

Using FOIL

$$\begin{aligned} (a + b)^2 &= (a + b)(a + b) \\ &= a^2 + \underline{ab} + \underline{ab} + b^2 \\ &= a^2 + 2ab + b^2 \end{aligned}$$

Using a shorter method

- square the first term
- multiply the two terms together and double
- square the last term.

Example:

$$\begin{aligned} (y + 3)^2 &= (y)^2 + (2 \times y \times 3) + (3)^2 \\ &= y^2 + 6y + 3^2 \end{aligned}$$

**Similarly  $(a - b)^2 = a^2 - 2ab + b^2$**

$$\begin{aligned} (w - 4)^2 &= (w)^2 + (2 \times w \times -4) + (-4)^2 \\ &= w^2 - 8w + 16 \end{aligned}$$

**Expanding Difference of Two Squares**

Use FOIL

$$\begin{aligned} (a + b)(a - b) &= a^2 - \underline{ab} + \underline{ab} - b^2 \\ &= a^2 - b^2 \end{aligned}$$

Recognise that the expansion of  $(a+b)(a-b)$  produces a difference of two squares  $a^2$  and  $b^2$

Example:

$$\begin{aligned} (y+3)(y-3) &= (y)^2 - (3)^2 \\ &= y^2 - 9 \end{aligned}$$
